The Royal Society, the national academy of science of the UK and the Commonwealth, is at the cutting edge of biological science. We support many top young scientists, engineers and technologists, influence science policy, debate scientific issues with the public and much more. We are an independent, charitable body and derive our authoritative status from over 1400 Fellows and Foreign Members.

Our mission is to expand knowledge and further the role of science and engineering in making the world a better place.

The Royal Society’s strategic priorities are to:
- invest in future scientific leaders and innovation;
- influence policy making with the best scientific advice;
- encourage science and mathematics education;
- increase access to the best science internationally, across the world;
- inspire an interest in the joy, wonder and excitement of scientific discovery.

GUILDANCE FOR AUTHORS

Selection criteria

The criteria for selection are work of outstanding importance, scientific excellence, originality and interest to a wide spectrum of biologists. The Editors are responsible for all editorial decisions and they make these decisions based on the reports received from the referees and/or Editorial Board members.

Many good manuscripts are submitted to us than we have space to print, and we give preference to those that present significant advances of broad interest. Submission of preliminary reports, of articles that merely confirm previous findings, and of articles that are likely to interest only small groups of specialists, is not encouraged. All articles are sent to Editorial Board members for an initial assessment of their suitability, and may be returned to authors without in-depth peer review if this assessment makes it seem unlikely that they will be accepted.

Publishing format

Proc. R. Soc. B articles are regularly published online and in print issues twice a month. Along with all Royal Society journals, we are committed to archiving and providing perpetual access. Although papers are limited to ten journal pages in length (with a per-page charge for articles exceeding six pages), there is the facility for including Electronic Supplementary Material (ESM). Contents of the ESM might include details of methods, derivations of equations, large tables of data, DNA sequences and computer programs.

For further information on the Society’s activities, please contact the following departments on the extensions listed by dialing +44 (0)20 7839 5561, or visit the Society’s website for further details.

A Q A: Next to create confusion! This is an atypical nest of the little wattlebird (Anthochaera chrysoptera) collected from Bangham, South Australia. This post-constructed nest has a thermal conductance that is only 78% of the value predicted for a 68°C incubating parent. Perhaps insulation isn’t everything, after all? (See pages 2042-2043). Image courtesy of Craig Rehan; bird nest sample courtesy of the South Australian Museum.)
